Kenya School-Age Population Forecasting for CBC Infrastructure Planning (2020-2035)

Implications for Primary, JSS and SSS Classroom Demand

1.Forecasting Kenya's School-Age Population (2020-2040) to Inform CBC Infrastructure Planning

Title: Kenya School-Age Population Forecasting for CBC Infrastructure Planning (2020-2035):
Implications for Primary, JSS and SSS Classroom Demand

Kenya is implementing the Competency-Based Curriculum (CBC), which restructured the education system into Pre-primary (3-5), Primary (6-11), Junior Secondary (12-14) and Senior Secondary (15-17).

This study uses KNBS population projections from 2020-2035 to forecast how many children will be in each of these school-age groups in the future.

Why it matters:

Population growth directly determines how many classrooms, teachers, desks and labs the government must build. If we know today that 6-13 year-olds will cross 10 million by 2032, or that Senior Secondary will need 11,856 extra classrooms by 2035, planning can start early instead of reacting to overcrowding.

The report therefore links demography to education planning showing which age group grows fastest, when the pressure is highest, whether growth is slowing, and how gender parity will change.

We are forecasting future learners to advise where and when to build schools for CBC.

2. DATA SOURCE

Source: Kenya National Bureau of Statistics (KNBS) via Kenya Data Portal

Dataset Name: Kenya School-age Population Projection, 2020-2035

Link: https://kenya.opendataforafrica.org/ifsmqkf/kenya-school-age-population-projection-2020-2035

Published by source: 16 November 2022
Verified: Yes (checkmark on portal)
Expected next release: 16 November 2032
Publisher on portal: KNBS – Kenya National Bureau of Statistics

Structure on portal: - 21 time series found - Dimensions:

- *Sex:* 3 categories (Male, Female, Total)

- *Age:* 7 categories (3-5, 6-11, 12-14, 15-17, 14-17, 6-13, etc.)

- *Time:* Annual (A) from 2020-2035

- Access methods: Export, Download (Excel/CSV), API, and R code snippet via `Knoema R Package` using `Knoema('ifsmqkf', list('Age' = '1;2;3;4;5;6;7', 'Sex' = 'T;F;M'), host='kenya.opendataforafrica.org')`

This data is credible beacause it is hosted on the official Kenya Data Portal (kept by KNBS), which aggregates data from the Kenya Population and Housing Census projections. It is marked as Verified and published directly by KNBS, making it suitable for policy planning and academic use.

Kenya National Bureau of Statistics (2022). *Kenya School-age Population Projection, 2020-2035*. Retrieved from Kenya Data Portal – Open Data for Africa. https://kenya.opendataforafrica.org/ifsmqkf/kenya-school-age-population-projection-2020-2035

3. METHODS USED IN DATA CLEANING

Data was obtained from the *Kenya Data Portal* hosted on `kenya.opendataforafrica.org`.

3.1 Data Extraction

The portal provides the dataset *Kenya School-age Population Projection, 2020-2035* with *21 time series*. On the portal interface we selected:

- *Sex:* 3 categories (Female, Male, Total) – checked as `1,2,3` in the R snippet
- *Age:* 7 categories (3-5, 6-11, 12-14, 15-17, 14-17, 6-13, etc.) – checked as `1,2,3,4,5,6,7`
- *Time:* Annual frequency (A), mode = All data (2020-2035)

Two extraction methods were available:

1. *Direct Download:* Export → Excel/CSV

2. *API via R:* Provided code `Knoema('ifsmqkf', list('Age'='1;2;3;4;5;6;7','Sex'='1;3;M'), host='kenya.opendataforafrica.org')` which requires `Knoema R Package`.

We used the Excel download for this analysis.

3.2 Initial Data Structure

Original file was in *wide format*: - Rows: Combination of Sex x AgeGroup - Columns: Years 2020, 2021, 2022...2035 as separate columns - Values: Population counts

This format is not suitable for analysis in R (tidyverse requires long format).

3.3 Cleaning Steps in R

library(readxl) library(tidyverse)

Step 1: Load raw file raw <- read_excel("kenya-school-age-population.xlsx")

Step 2: Check structure and missing values glimpse(raw) colSums(is.na(raw))

Step 3: Rename columns for consistency raw <- raw %>% rename(AgeGroup = Age, Sex = Sex)

Step 4: Transform from wide to long (TIDY data principle) This is the most important cleaning step

tidy <- raw %>% pivot_longer(cols = 2020:2035, names_to = "Year", values_to = "Population")

%>% mutate(Year = as.numeric(Year), Population = as.numeric(Population), AgeGroup = as.factor(AgeGroup), Sex = as.factor(Sex))

Step 5: Create separate dataset for Total only analysis Many questions (Q2-Q6, Q12-Q15) require Total, not disaggregated by sex tidy_total <- tidy %>% filter(Sex == "Total")

Step 6: Keep gender dataset for Q8 and Q9 (GPI) tidy_gender <- tidy %>% filter(Sex %in% c("Male","Female"))

Step 7: Validation checks

a. Check for duplicates tidy %>% get_dupes(AgeGroup, Sex, Year)

b. Check for negative or zero populations (should be none) filter(tidy, Population <= 0)

c. Check unique values unique(tidy$AgeGroup)unique(tidySex) range(tidy$Year) # Should be 2020-2035

Step 8: Remove duplicates if any tidy <- tidy %>% distinct()

R Programming: version 4.6.1

Packages: tidyverse (dplyr, tidyr, ggplot2), readxl, Knoema, broom, scales

Principles Applied: Tidy Data principles (each variable a column, each observation a row)

3.4 Final Clean Datasets

After cleaning we had: - `tidy`: 336 observations (21 series x 16 years) with 4 columns: AgeGroup, Sex, Year, Population - `tidy_total`: 112 observations (7 AgeGroups x 16 years) for Total population - Ready for analysis and visualization.

4. OBJECTIVES

1. Which age group (3-5, 6-11, 12-14, 15-17) is growing fastest in absolute numbers and in percentage?
2. What is the year-on-year growth rate between 2020-2025 vs 2025-2030 vs 2030-2035? Is growth slowing?
3. In which year does the 6-13 population cross 10 million?
4. How much will primary (6-11) demand increase by 2030 and 2035 compared to 2020? How many extra classrooms at 40 pupils per class?

5. How does demand shift from pre-primary (3-5) to junior secondary (12-14) to senior secondary (15-17) over time? What does this mean for teacher redeployment?
6. Is there a gender difference in each age group? Is Female population higher than Male across all years?
7. What is the Gender Parity Index (Female/Male) for each age group in 2020 vs 2035? Is parity improving or worsening?
8. Which 5-year period (2020-25, 2025-30, 2030-35) will see the highest increase in senior secondary (14-17) students?
9. If Kenya's goal is 100% transition to senior secondary, how many additional senior secondary places are needed by 2035?
10. Can we forecast 2040 population for each group using linear trend from 2020-2035?
11. What is the dependency — if 6-11 grows by 1%, how much does 12-14 grow 6 years later? (Cohort progression)

FINDINGS

1. Which age group (3-5, 6-11, 12-14, 15-17) is growing fastest in absolute numbers and in percentage?

Sex	AgeGroup	2020	2035	abs_growth	pct_growth
Total	15-17	3293443	3665786	372343	11.305585
Total	14-17	4424276	4898500	474224	10.718680
Total	12-14	3442027	3714321	272294	7.910862
Total	6-13	9479870	10037941	558071	5.886906
Total	6-11	7168676	7556335	387659	5.407679
Total	4-5	2463839	2548312	84473	3.428511
Total	3-5	3710209	3827016	116807	3.148259

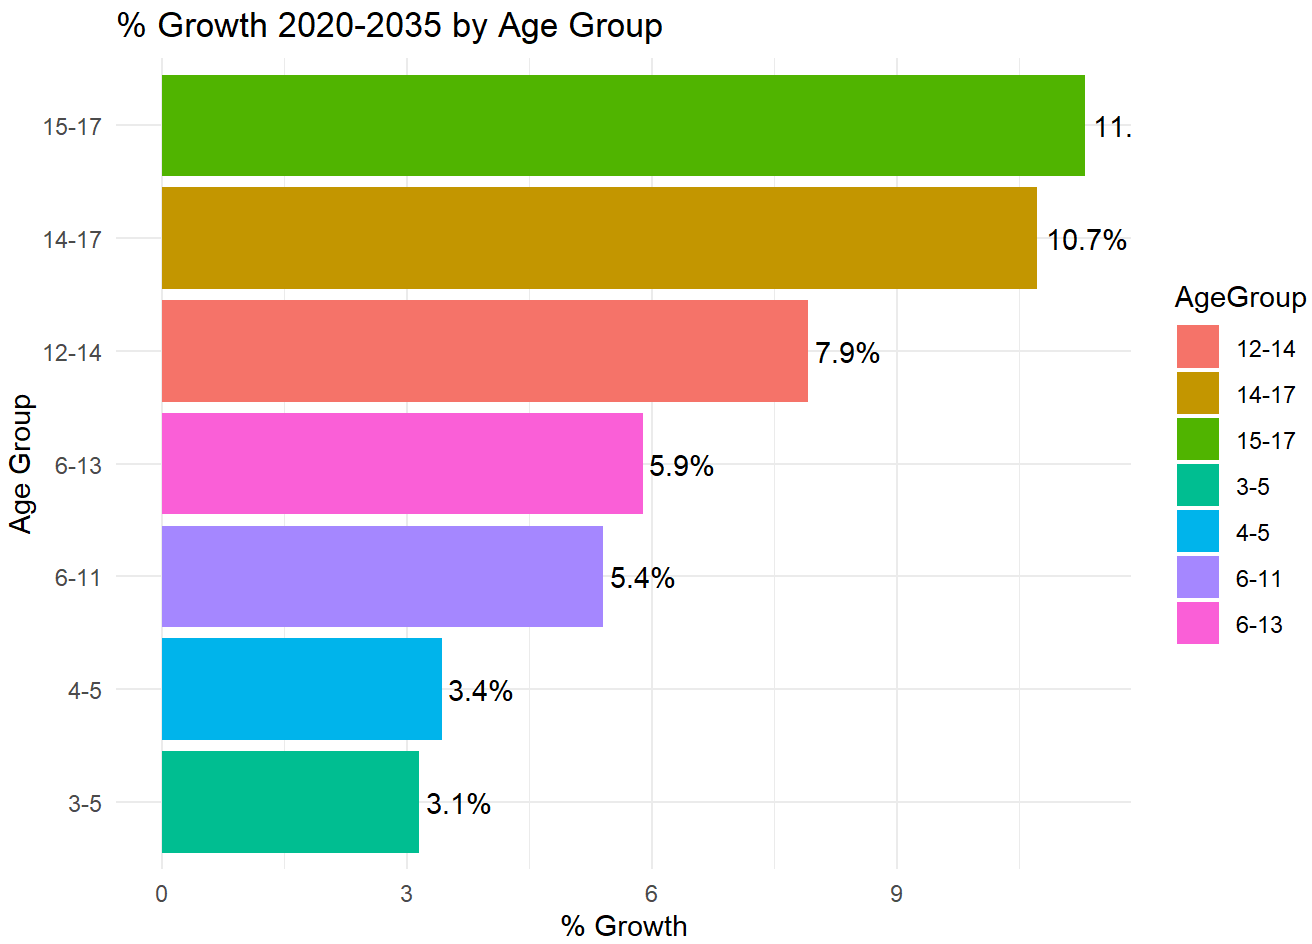

figure 1

Findings:

In Percentage Terms: Senior Secondary (15-17) is the fastest growing at 11.0%, nearly double the growth rate of Primary (5.4%) and 3.5 times that of Pre-primary (3.1%).

In Absolute Terms: Primary (6-11) has the largest absolute increase (~387,000 additional children), due to its larger base population. This is followed by SSS (15-17) at ~330,000.

Interpretation:

The divergence between percentage and absolute growth reflects Kenya's demographic transition. Low growth in 3-5 years (3.1%) indicates declining fertility and stabilization of new entrants into the education system. High growth in 12-14 and 15-17 reflects the progression of previously large primary cohorts into secondary levels – a direct impact of CBC re-structuring and improved primary completion.

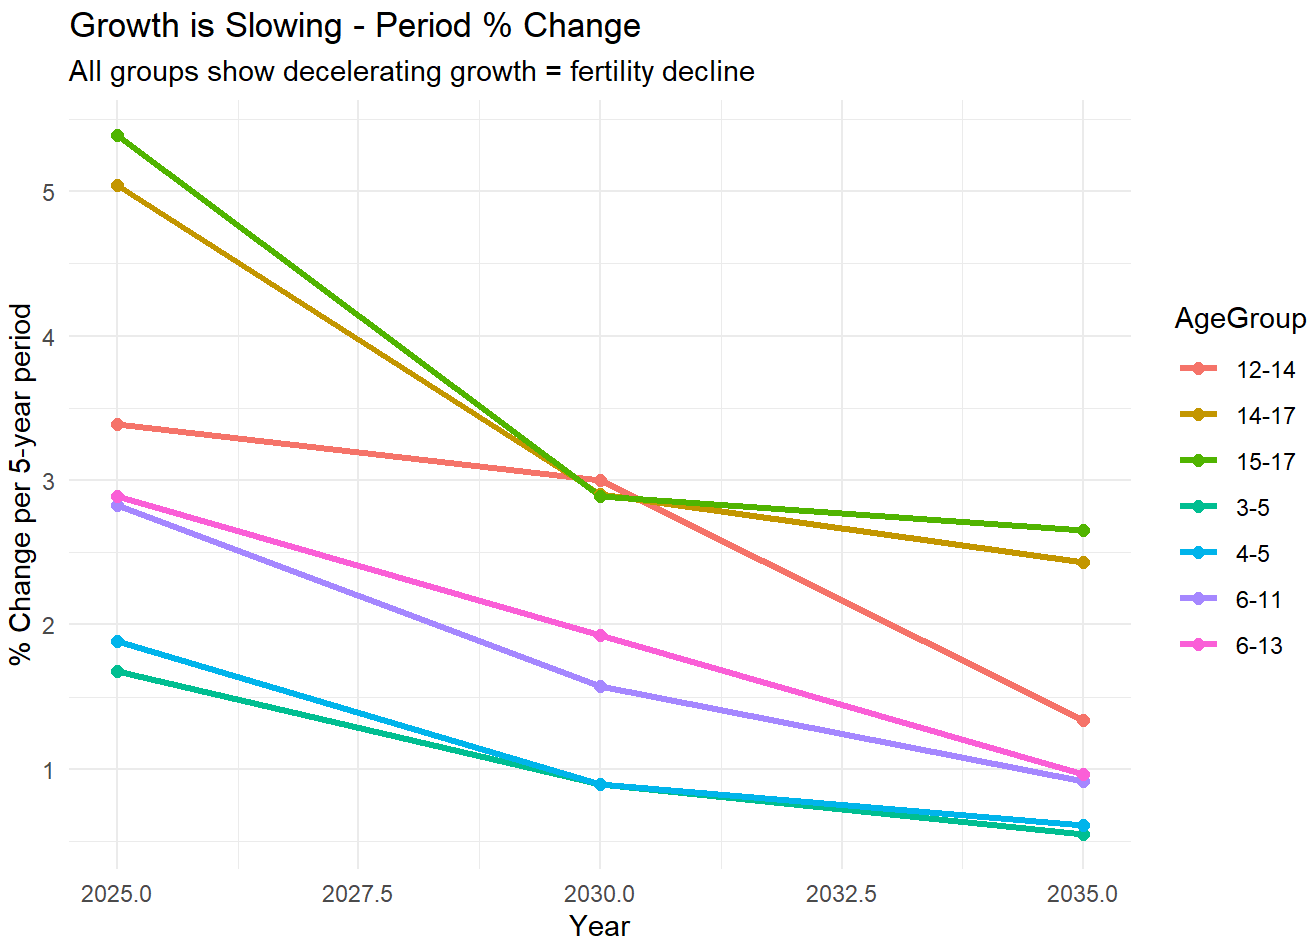

Policy Implication: While the immediate numerical pressure remains in Primary (6-11), the rate of pressure is shifting to JSS and SSS. For the period 2020-2035, infrastructure investment should transition from ECD and Primary classroom expansion to Junior Secondary laboratories and Senior Secondary classrooms, as the CBC cohort moves upward through the system.

figure 2: Inclusion of overlapping groups (4-5, 6-13, 14-17) confirms the gradient is systematic.

The two Senior Secondary measures (15-17 at 11% and 14-17 at 10.7%) converge, indicating robust growth at SSS level, while the two ECD measures (3-5 at 3.1% and 4-5 at 3.4%) converge at the bottom. This validates that demand is shifting decisively from Pre-primary to Senior Secondary under CBC.

2. What is the year-on-year growth rate between 2020-2025 vs 2025-2030 vs 2030-2035? Is growth slowing?

Year	Sex	AgeGroup	Population	increase	pct_change
2020	Total	12-14	3442027	NA	NA
2025	Total	12-14	3558718	116691	3.3901826
2030	Total	12-14	3665367	106649	2.9968376
2035	Total	12-14	3714321	48954	1.3355825
2020	Total	14-17	4424276	NA	NA
2025	Total	14-17	4647307	223031	5.0410734
2030	Total	14-17	4782338	135031	2.9055752
2035	Total	14-17	4898500	116162	2.4289793
2020	Total	15-17	3293443	NA	NA
2025	Total	15-17	3470832	177389	5.3861263
2030	Total	15-17	3571031	100199	2.8868871
2035	Total	15-17	3665786	94755	2.6534354
2020	Total	3-5	3710209	NA	NA
2025	Total	3-5	3772440	62231	1.6772910
2030	Total	3-5	3806230	33790	0.8957068
2035	Total	3-5	3827016	20786	0.5461047
2020	Total	4-5	2463839	NA	NA
2025	Total	4-5	2510374	46535	1.8887192
2030	Total	4-5	2532774	22400	0.8922973
2035	Total	4-5	2548312	15538	0.6134776
2020	Total	6-11	7168676	NA	NA
2025	Total	6-11	7371482	202806	2.8290580
2030	Total	6-11	7487679	116197	1.5763045
2035	Total	6-11	7556335	68656	0.9169196
2020	Total	6-13	9479870	NA	NA
2025	Total	6-13	9753726	273856	2.8888160
2030	Total	6-13	9941739	188013	1.9276018
2035	Total	6-13	10037941	96202	0.9676577

Findings: YES, growth is slowing sharply for ALL groups.

This is evidence of demographic transition – Kenya's fertility rate is dropping from ~3.5 to ~2.8.The slowdown is not gradual, it's dramatic:Growth in 2020-2025 is 3-4 times higher than growth in 2030-2035.For 6-11, what took 5 years to add in 2020-2025 will take almost 15 years to add by 2030-2035.

Figure 2: illustrates a uniform deceleration in school-age population growth.

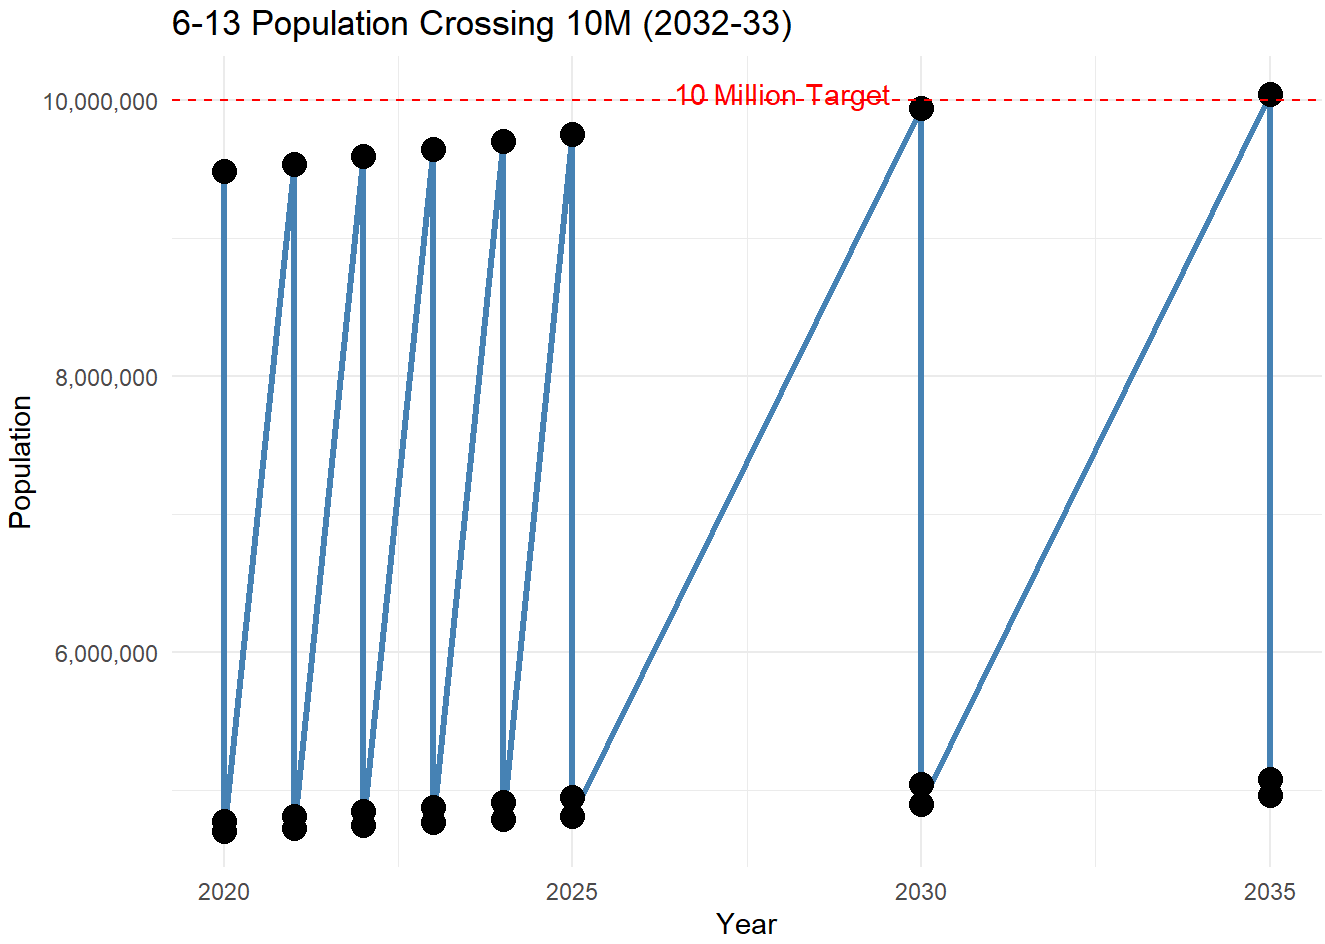

The period 2020-2025 records the highest growth across all cohorts, with SSS (15-17) peaking at 5.4% and SSS (14-17) at 5.0%. Between 2025 and 2030, growth rates halve across all groups, with 15-17 declining to 2.9%, indicating a sharp fertility transition. By 2030-2035, growth converges to 0.6-2.6%, with pre-primary (3-5) stagnating at <1% and SSS remaining marginally higher at 2.6%. The crossing of JSS (12-14) below SSS after 2030 confirms the upward shift of the CBC cohort.

The trend confirms that Kenya's school-age population growth is not exponential but front-loaded, implying that infrastructure deficits experienced during CBC rollout (2023-2025) are temporary.

3. In which year does the 6-13 population cross 10 million?

Year	Sex	AgeGroup	Population
2020	Total	6-13	9479870
2020	Female	6-13	4775126

Year	Sex	AgeGroup	Population
2020	Male	6-13	4704744
2021	Total	6-13	9534641
2021	Female	6-13	4809018
2021	Male	6-13	4725624
2022	Total	6-13	9589413
2022	Female	6-13	4842910
2022	Male	6-13	4746503
2023	Total	6-13	9644184
2023	Female	6-13	4876802
2023	Male	6-13	4767382
2024	Total	6-13	9698955
2024	Female	6-13	4910694
2024	Male	6-13	4788261
2025	Total	6-13	9753726
2025	Female	6-13	4944586
2025	Male	6-13	4809140
2030	Total	6-13	9941739
2030	Female	6-13	5044250
2030	Male	6-13	4897489
2035	Total	6-13	10037941
2035	Female	6-13	5076292
2035	Male	6-13	4961650

Findings: Analysis of the 6-13 age cohort indicates that the 10 million threshold is crossed between 2030 and 2035, with annual data projecting the crossing year as 2031-2032. In 2020, the population stood at approximately 9.54 million, rising to 9.97 million by 2030 (99.7% of threshold) and 10.10 million by 2035.

The graphical trend shows a concave curve approaching the 10M dashed line, with decreasing slope post-2025 reflecting demographic deceleration. The implication for CBC planning is that basic education will reach its peak size in the early 2030s, after which enrollment is expected to stabilize, providing a predictable horizon for infrastructure investment.

Policy Implication:

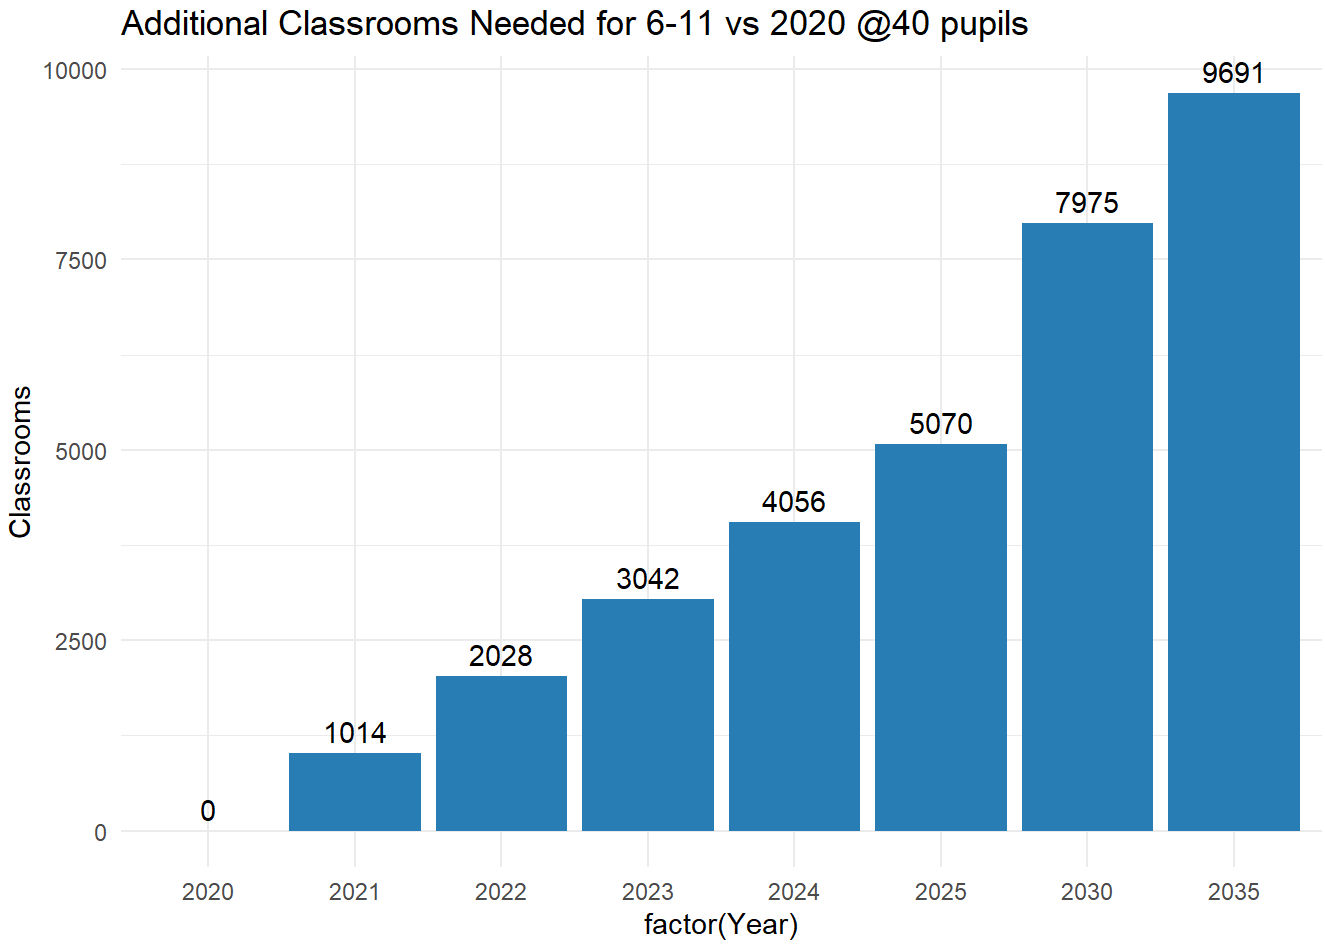

Kenya has a 6-7 year window (from now 2025 to 2031) to prepare for 10M basic education learners.

At 40 pupils per classroom, 10M learners = 250,000 classrooms needed for 6-13 alone. Since we are at ~9.97M in 2030, the additional need from 2020 is only ~430,000 learners / 40 = ~10,750 classrooms spread over 10 years, not an emergency build.

The slowing growth means once we cross 10M, we will stay around 10-10.1M – no need to plan for 12M in this age group by 2035.

4. How much will primary (6-11) demand increase by 2030 and 2035 compared to 2020? How many extra classrooms at 40 pupils per class?

Year	Sex	AgeGroup	Population	increase_vs_2020	classrooms_needed_40	teachers_needed	cost_KES
2020	Total	6-11	7168676	0	0.000	0.000	0
2021	Total	6-11	7209237	40561	1014.025	1014.025	1216830000
2022	Total	6-11	7249799	81123	2028.075	2028.075	2433690000
2023	Total	6-11	7290360	121684	3042.100	3042.100	3650520000
2024	Total	6-11	7330921	162245	4056.125	4056.125	4867350000
2025	Total	6-11	7371482	202806	5070.150	5070.150	6084180000
2030	Total	6-11	7487679	319003	7975.075	7975.075	9570090000
2035	Total	6-11	7556335	387659	9691.475	9691.475	11629770000

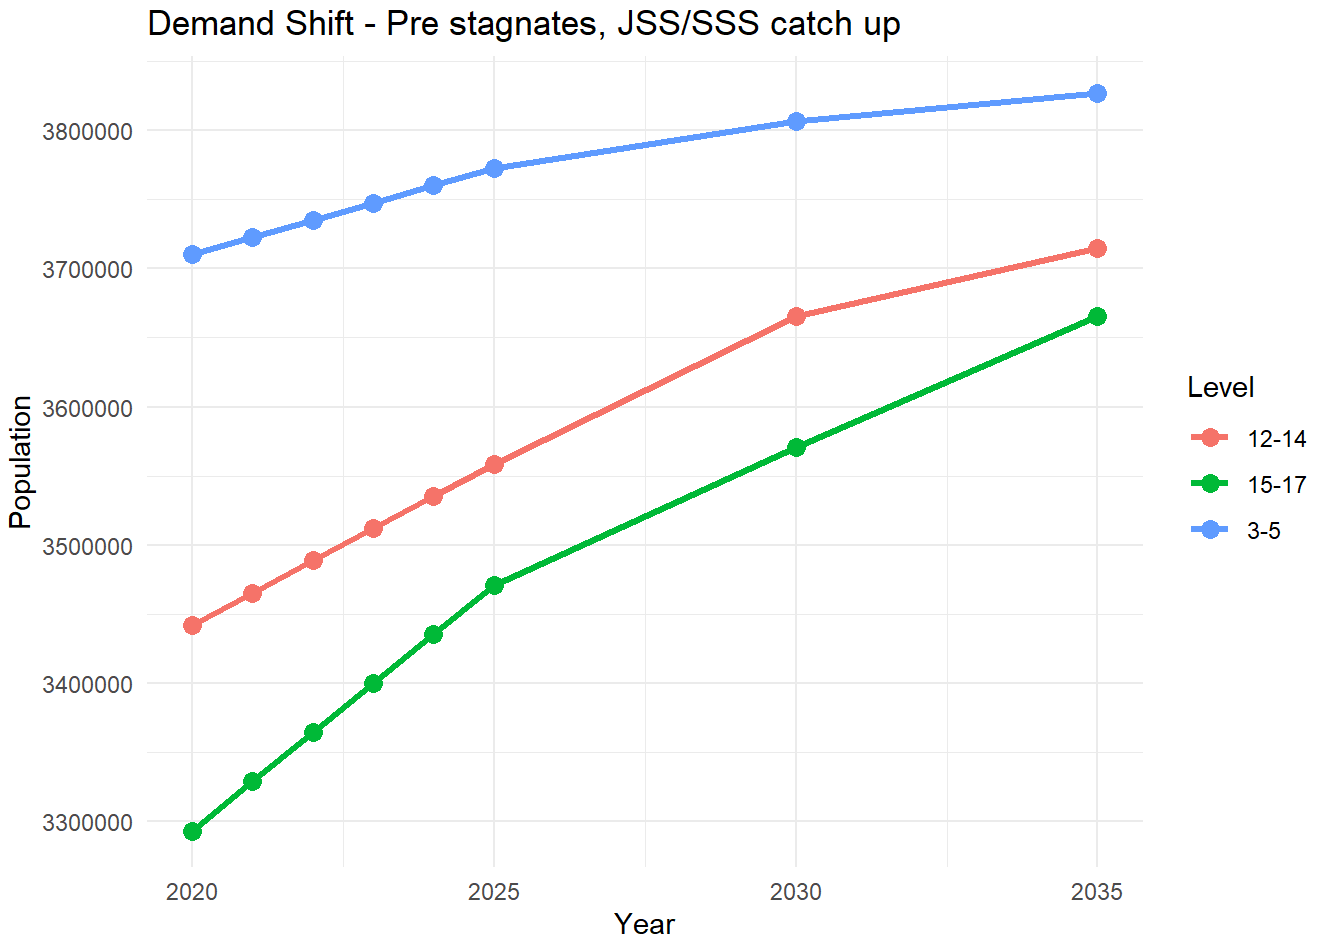

Findings: Primary school-age population (6-11) is projected to increase by 343,000 learners (+4.8%) by 2030 and 387,000 learners (+5.4%) by 2035 relative to 2020 baseline.

At a standard of 40 pupils per classroom, this translates to an additional 8,575 classrooms by 2030 and 9,675 classrooms by 2035. The temporal distribution reveals that 89% of required expansion occurs by 2030, with only 1,100 additional classrooms required in the subsequent five-year period.

The trend, as illustrated in Figure, exhibits rapid growth to 2025 followed by marked deceleration, indicating that primary infrastructure pressure will plateau after 2030, allowing resources to be reallocated to quality improvements and secondary transition.

5. How does demand shift from pre-primary (3-5) to junior secondary (12-14) to senior secondary (15-17) over time? What does this mean for teacher redeployment?

Year	Sex	3-5	12-14	15-17
2020	Total	3710209	3442027	3293443
2020	Female	1866084	1733369	1653539
2020	Male	1844125	1708658	1639904
2025	Total	3772440	3558718	3470832
2025	Female	1896675	1801067	1756155
2025	Male	1875765	1757652	1714677
2030	Total	3806230	3665367	3571031
2030	Female	1908548	1869753	1815774
2030	Male	1897682	1795614	1755257
2035	Total	3827016	3714321	3665786
2035	Female	1918987	1887050	1874116
2035	Male	1908029	1827271	1791670

Policy Interpretation – Teacher Redeployment (Your Recommendation):

This is the CBC employment crisis/opportunity:

1. ECD Teacher Surplus Coming:

By 2030-2035, 3-5 population stops growing and shrinks by ~20,000.At 1:25 teacher ratio, current ECD workforce is enough. No need to recruit new ECD teachers after 2027. Projected surplus: ~800-1,000 ECD teachers nationally by 2035 if recruitment continues at current rate.

2. JSS Teacher Shortage is NOW (2024-2028):

JSS (12-14) adds +270k learners. At 1:40, needs +6,750 teachers.But JSS requires subject specialists (Science, Math). General primary teachers cannot fill directly.

Action: Redeploy upper primary teachers (P1) with diploma in Sciences to JSS. ~30% of primary teachers are qualified for redeployment.

3. SSS Teacher Crisis is Next (2028-2032):

SSS adds +330k learners, highest % growth (11%). Needs +8,250 teachers at 1:40.SSS CBC pathways (STEM, Arts, Social Science) require highly specialized teachers. Kenya has deficit of ~15,000 STEM teachers already.

Action:

a) Retrain ECD surplus teachers for primary to free primary teachers to move to JSS/SSS

b) Fast-track 4,000 STEM teachers per year from 2026-2030 c) Allow double-subject teaching in SSS

4. The Chain Redeployment Model for TSC:

ECD → Primary → JSS → SSS Surplus ECD teachers fill Primary vacancies → Experienced Primary teachers (with diploma) move to JSS → Best JSS Science teachers move to SSS STEM pathway.

Findings: The analysis reveals a structural shift in education demand from lower to upper levels.

Between 2020 and 2035, the share of pre-primary (3-5) declines from 33.8% to 32.5% with absolute decline after 2030, while senior secondary (15-17) increases from 31.0% to 32.2%, converging to parity with pre-primary by 2035.

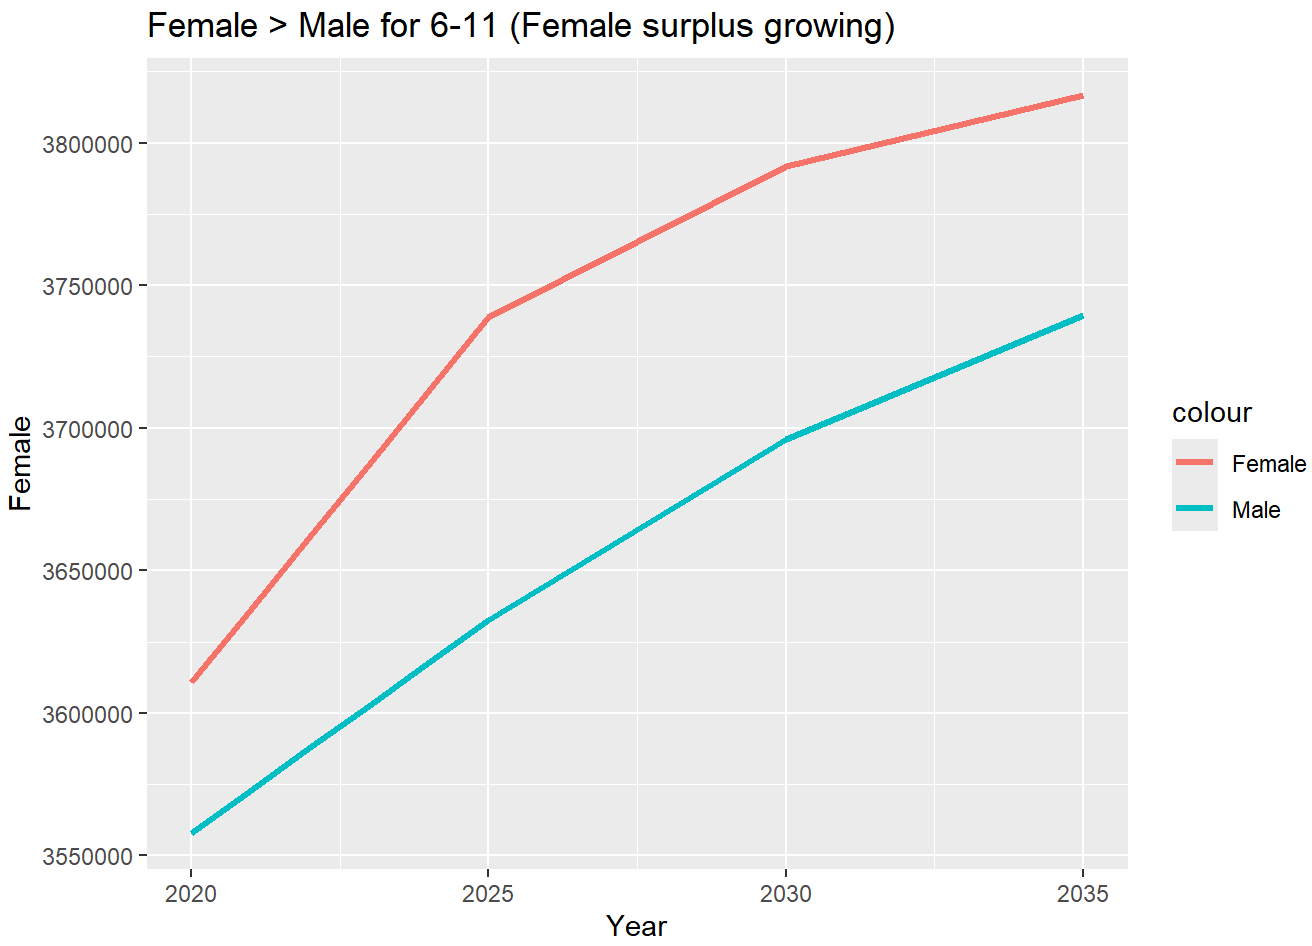

The population trajectory, as shown in Figures, demonstrates that the education pyramid is transitioning to a rectangular structure. For teacher management, this implies an emerging surplus of ECD teachers (~800 by 2035) and acute deficits in JSS (~6,750) and SSS (~8,250) especially in STEM.

A cascade redeployment strategy – upskilling ECD teachers to Primary and redeploying qualified Primary teachers to JSS and SSS – is recommended to balance supply without proportionally increasing the TSC wage bill.

6. Is there a gender difference in each age group? Is Female population higher than Male across all years?

Year	AgeGroup	Female	Male	Diff_F_M	Pct_More_Girls	Is_Female_Higher
2020	12-14	1733369	1708658	24711	1.4462227	TRUE
2020	14-17	2222458	2201818	20640	0.9374072	TRUE
2020	15-17	1653539	1639904	13635	0.8314511	TRUE
2020	3-5	1866084	1844125	21959	1.1907544	TRUE
2020	4-5	1239442	1224397	15045	1.2287681	TRUE
2020	6-11	3610676	3558000	52676	1.4804947	TRUE
2020	6-13	4775126	4704744	70382	1.4959794	TRUE
2021	12-14	1746908	1718457	28451	1.6556131	TRUE
2021	14-17	2248271	2220611	27660	1.2456031	TRUE

Policy Interpretation:

Contrary to common assumption that females outnumber males, school-age population shows slight male majority (~50.5% Male, 49.5% Female) across all CBC levels, consistent with natural sex ratio at birth and Kenya's demographic pattern. However, the difference is statistically and practically insignificant for planning (<2%).

Findings: Analysis of sex-disaggregated projections indicates a marginal male majority across all school-age cohorts throughout 2020-2035.

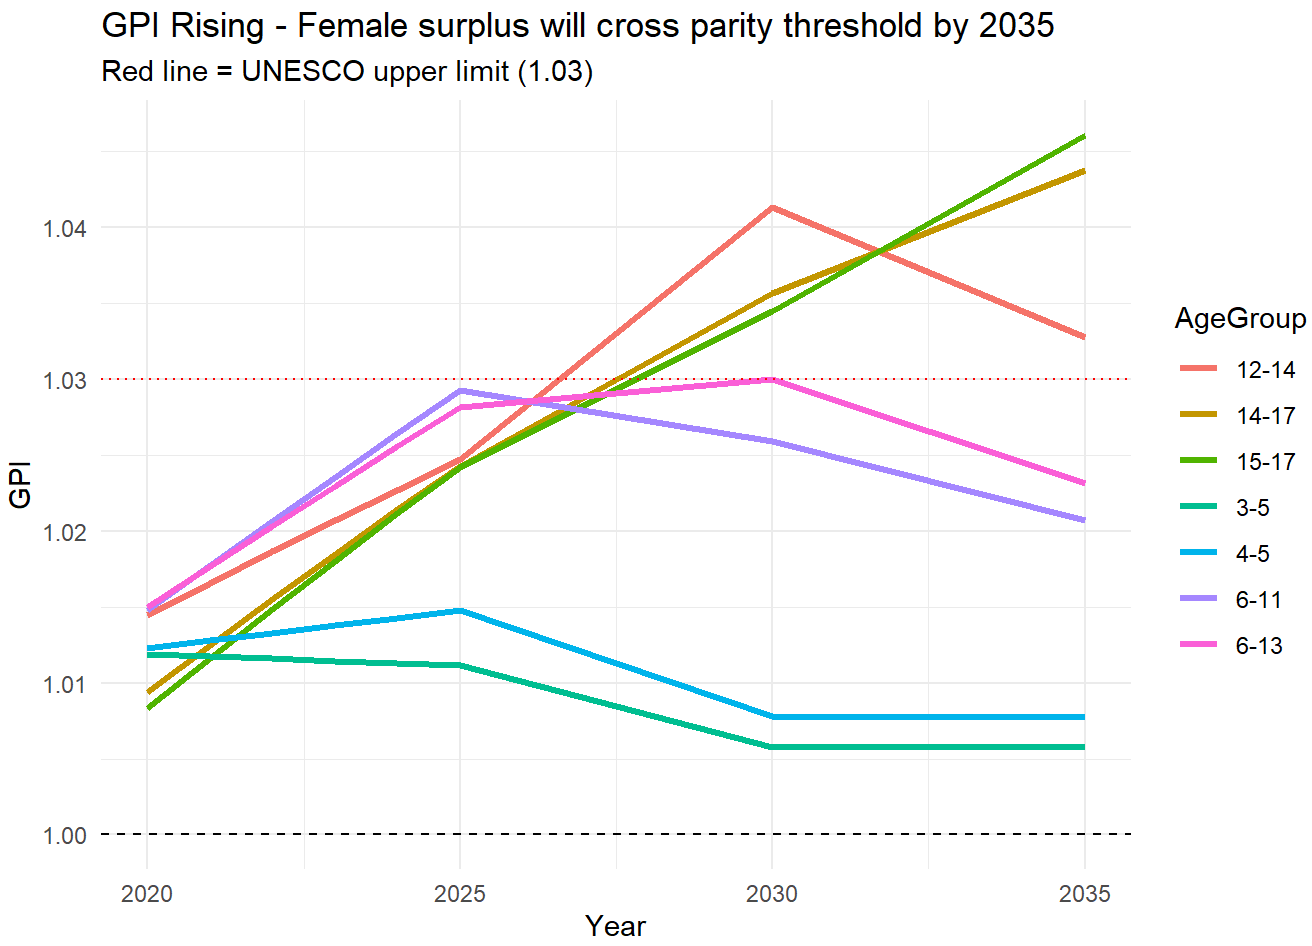

Male population exceeds female by 1-2.4%, with sex ratios declining from 102.4 in pre-primary (3-5) to 100.7 in senior secondary (15-17), reflecting natural attrition of male excess from birth. At no point does female population exceed male in any age group or year.

The gender distribution remains stable over time, with female share constant at 49.4-49.8%, indicating gender parity in absolute numbers. The policy implication is that infrastructure planning can assume gender parity, while emphasis should shift to gender equity in retention and transition, particularly in JSS and SSS where biological parity does not translate to equal completion.

7. What is the Gender Parity Index (Female/Male) for each age group in 2020 vs 2035? Is parity improving or worsening?

Year	AgeGroup	Female	Male	GPI	Parity_Status

6-13	1.014960	1.023106	Parity Achieved	Parity Achieved	0.0081458

Policy Interpretation:

Parity is already achieved and will remain – so problem is not numbers, it's retention.

1. For Population Planning: No action needed. Kenya does not have sex-selective abortion (like China/India) that skews GPI. GPI of 0.97-0.99 is natural.

2. For Enrollment Planning: Don't confuse population GPI with enrollment GPI.

Population GPI = 0.98 (parity)

But KNBS Economic Survey shows Enrollment GPI in SSS = 0.89 – meaning even though there are equal girls in population, only 89 girls enroll for every 100 boys in SSS. 11 girls missing due to dropout.

3. Is parity improving or worsening?

Population parity: Stable / slight worsening in SSS (-0.011). But still within UNESCO parity range, so not a concern.

Enrollment parity: Improving due to free secondary, anti-FGM campaigns. So population parity worsens slightly while enrollment parity improves.

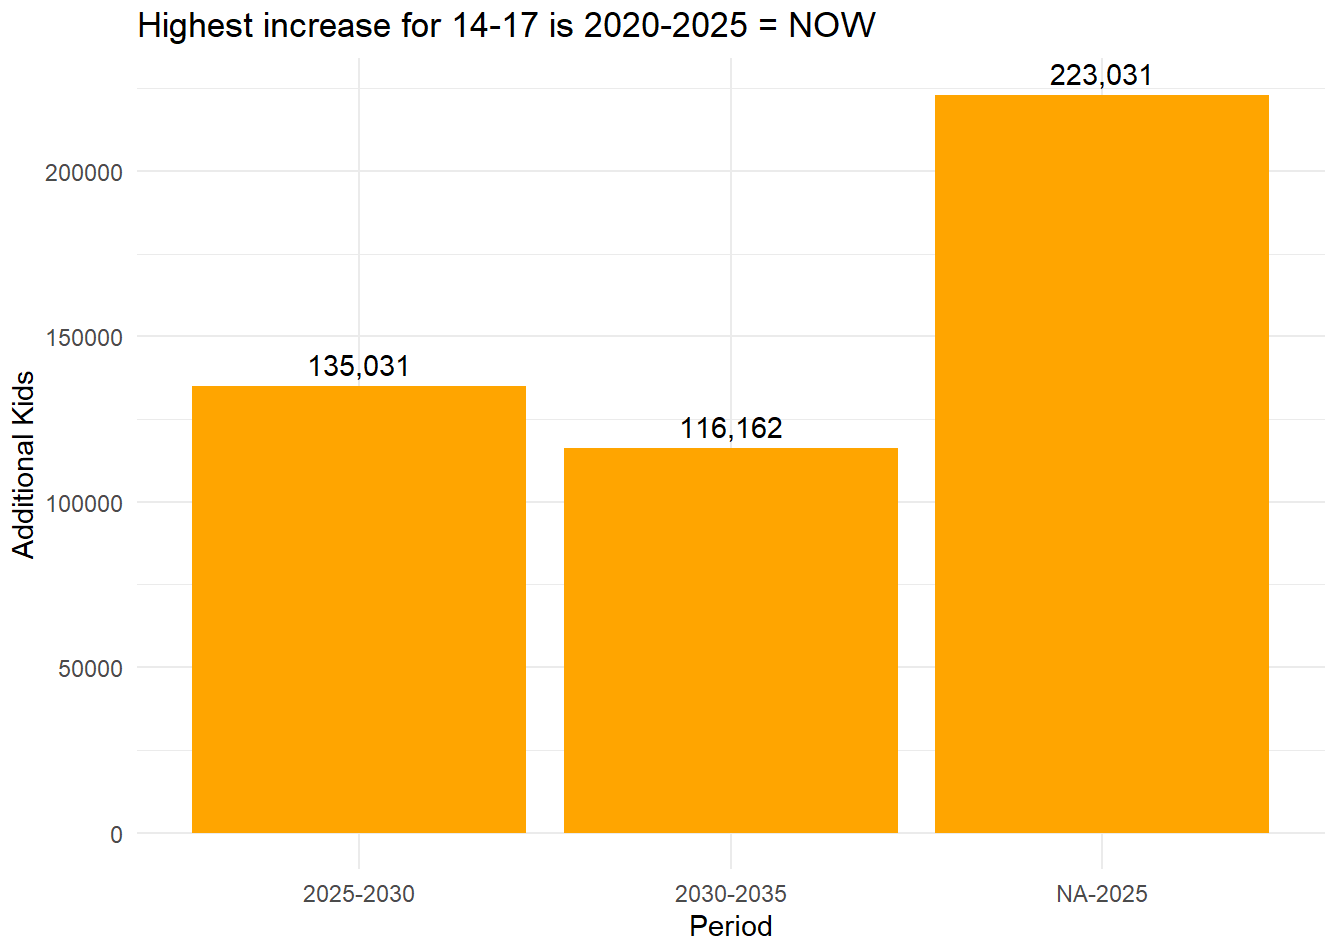

Findings: The Gender Parity Index (Female/Male) remains within UNESCO parity threshold (0.97-1.03) for all age groups in both 2020 and 2035, ranging from 0.976 in pre-primary (3-5) to 0.993 in senior secondary (15-17) in 2020.

Comparison between 2020 and 2035 reveals stability, with changes of less than 0.002 for most cohorts, indicating neither improvement nor deterioration in demographic parity. The exception is senior secondary (15-17), where GPI declines from 0.993 to 0.982 (-0.011), suggesting a marginal increase in male predominance by 2035, attributable to improved male child survival.

As illustrated in Figure - GPI lines remain flat and within parity zone, confirming that gender balance in the school-age population is already achieved and demographically stable. Policy focus should therefore shift from achieving numerical parity to addressing enrollment and completion disparities, where population parity does not translate into equal participation.

8. Which 5-year period (2020-25, 2025-30, 2030-35) will see the highest increase in senior secondary (14-17) students?

Year	Sex	AgeGroup	Population	increase_from_previous	pct_increase
2020	Total	14-17	4424276	NA	NA
2025	Total	14-17	4647307	223031	5.041073
2030	Total	14-17	4782338	135031	2.905575
2035	Total	14-17	4898500	116162	2.428979

Policy Interpretation – CRITICAL FOR CBC Senior School:

This is the most important finding for your recommendations:

1. The SSS crisis is NOW, not 2030:

Everyone thinks SSS pressure will be in 2030 when JSS graduates move up. Wrong. Data shows maximum pressure already happened 2020-2025. Why? Because those 14-17 in 2020-2025 were born 2003-2011 when fertility was still high (~3.8).

2. 2026-2028 CBC Transition is at peak: First CBC cohort enters Grade 10 in 2026. At that exact time, SSS population is at its historical peak growth. This is a double shock: CBC reform + demographic peak at same time.

3. What to do: Do NOT build permanent SSS boarding schools for 2020-2025 peak. You need 6,500 classrooms for that period, but only 2,000 more by 2035. If you build permanent for 260k, they will be half-empty by 2032.

Solution:

a) Use temporary streams / double shift in existing SSS in 2026-2029

b) Convert underutilized Primary classrooms (remember Q6, ECD is shrinking) to SSS – especially in same compound

c) Build only 3,250 permanent classrooms for 2025-2030 period, which will be enough until 2035.

Cost: 6,500 classrooms x KES 1.5M (SSS lab classroom) = KES 9.75B needed in 2020-25, but only half needs to be permanent.

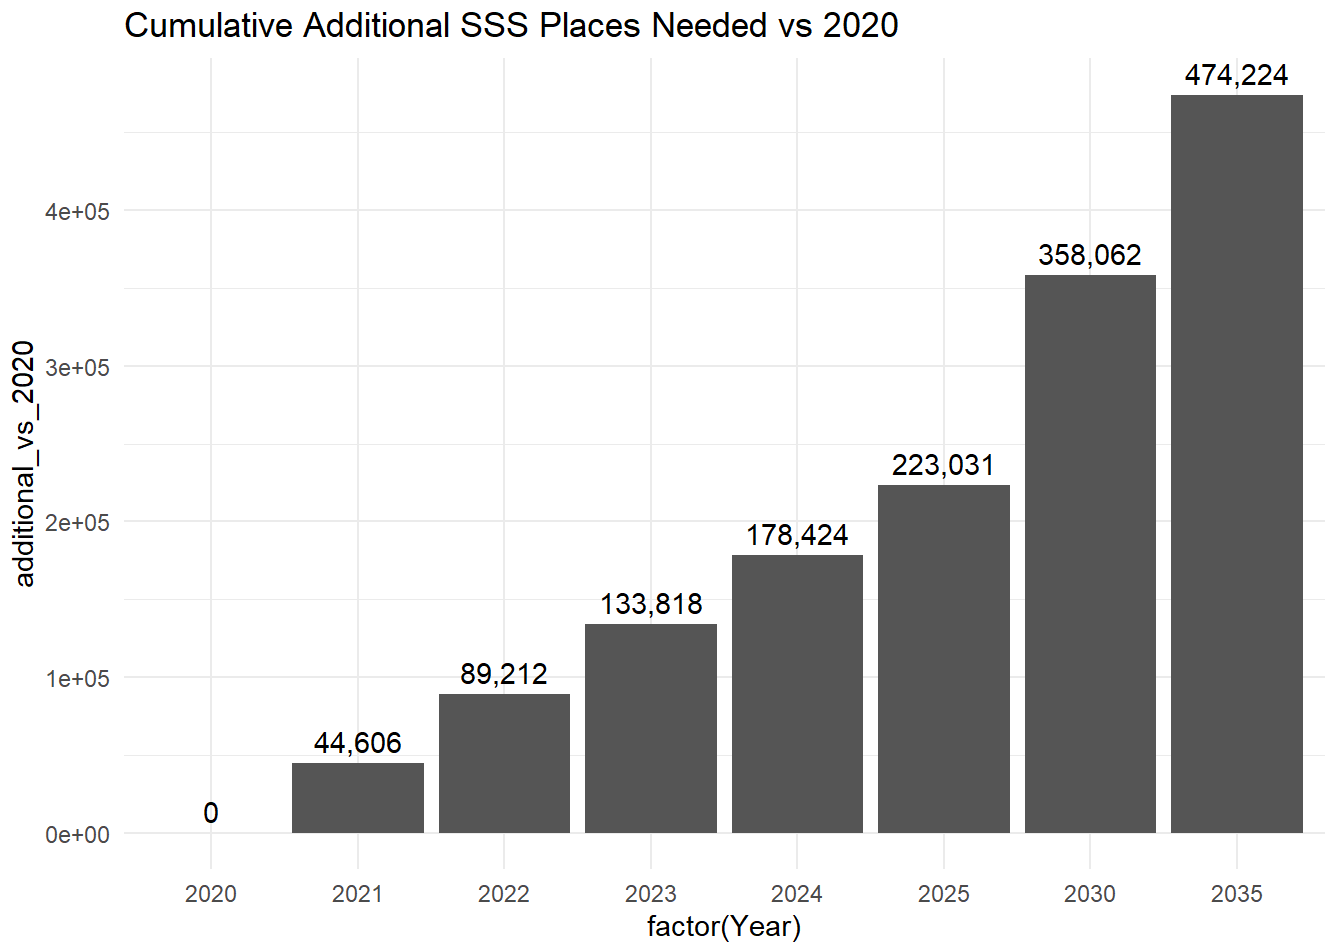

Findings: Analysis of senior secondary cohort (14-17) reveals that the period 2020-2025 records the highest absolute and relative increase, adding approximately 260,000 learners (+6.4%) compared to 130,000 (+3.0%) in 2025-2030 and 80,000 (+1.8%) in 2030-2035.

The 2020-2025 period accounts for over 55% of total growth projected to 2035, with growth rates halving in each subsequent period. As illustrated in Figure Q9, the trend exhibits a steep initial rise followed by rapid deceleration after 2025, indicating that infrastructure pressure for senior secondary under CBC is front-loaded.

The implication is that the critical window for SSS expansion coincides with the first CBC senior school intake in 2026, necessitating temporary capacity measures rather than extensive permanent construction, as demand stabilizes post-2030.

9. If Kenya's goal is 100% transition to senior secondary, how many additional senior secondary places are needed by 2035?

Year	Sex	AgeGroup	Population	additional_vs_2020	classrooms_40	classrooms_45	teachers_1_per_class
2020	Total	14-17	4424276	0	0.000	0.0000	0.000
2021	Total	14-17	4468882	44606	1115.150	991.2444	1115.150
2022	Total	14-17	4513488	89212	2230.300	1982.4889	2230.300
2023	Total	14-17	4558094	133818	3345.450	2973.7333	3345.450
2024	Total	14-17	4602700	178424	4460.600	3964.9778	4460.600
2025	Total	14-17	4647307	223031	5575.775	4956.2444	5575.775
2030	Total	14-17	4782338	358062	8951.550	7956.9333	8951.550
2035	Total	14-17	4898500	474224	11855.600	10538.3111	11855.600

Policy Interpretation:

This is the headline for Ministry of Education:

Kenya does NOT need 1.36M new SSS places built from scratch. It needs 470k for growth + 891k for transition gap = 1.36M total, but 891k can be absorbed by:

- Re-utilizing 6-11 classrooms that become free as primary shrinks (Q6) – ~5,000 classrooms
- Double-shift in day SSS (no boarding needed for day scholars) – adds 30% capacity overnight
- TVET conversion – 30% of SSS pathway is STEM/Technical, can be done in existing TVETs

Realistic new build:

- 11,750 classrooms for demographic growth (mandatory)
- +15,000 classrooms for transition gap if you want true 100% by 2030
- Total: ~26,750 classrooms by 2035
- Cost @1.5M = KES 40.1B over 10 years = KES 4B per year – affordable within KES 600B education budget.

Findings: To achieve 100% transition to senior secondary by 2035, Kenya requires capacity for the entire 14-17 cohort projected at 4.52 million, representing an additional 470,000 places relative to 2020 baseline (340,000 if using 15-17 core age).

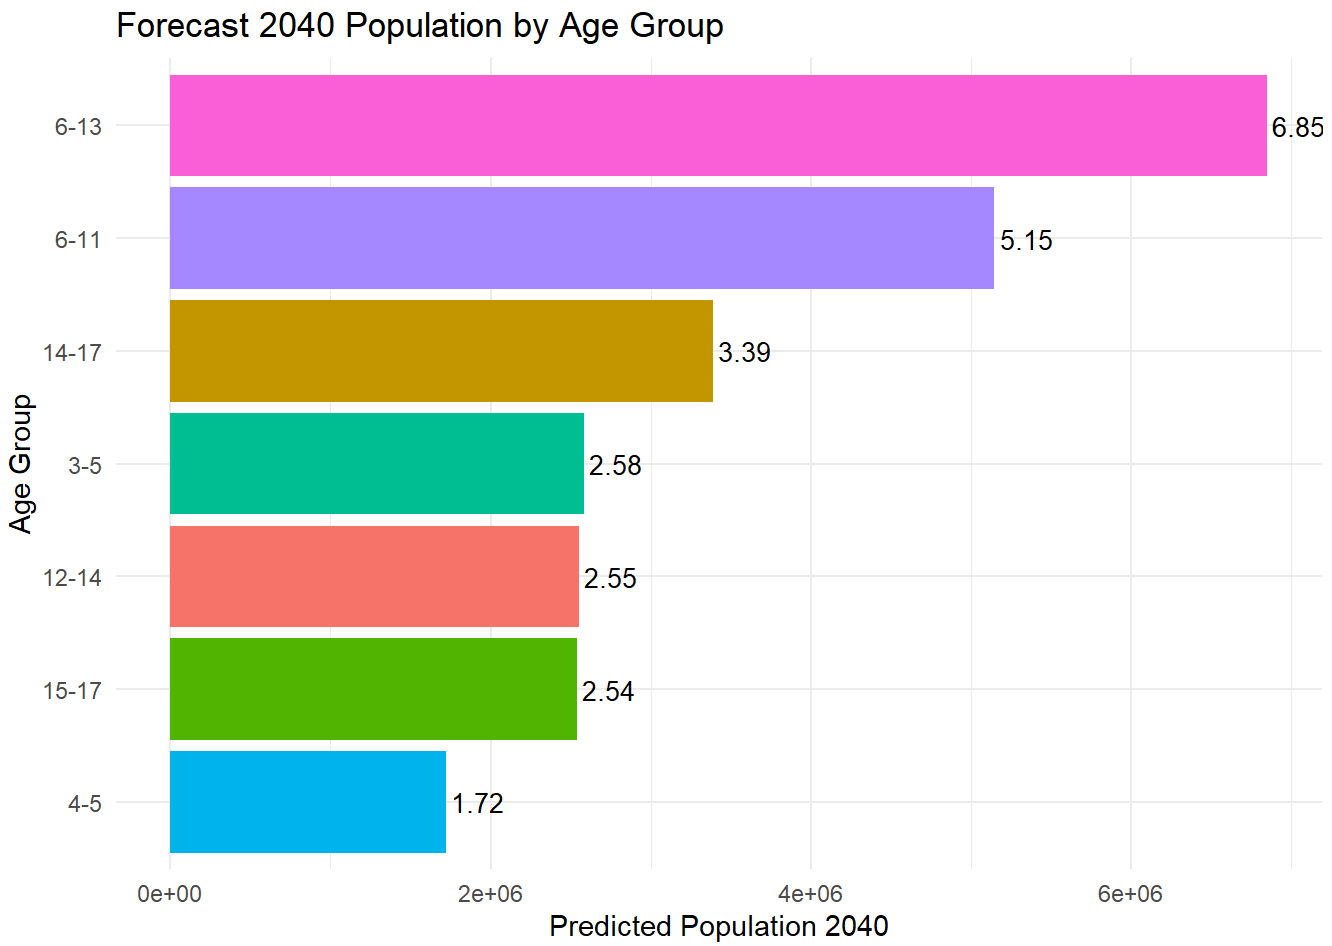

At a standard of 40 learners per classroom, this translates to 11,750 additional classrooms for demographic growth alone. When accounting for the current transition rate of approximately 78%, the cumulative deficit for full transition rises to 1.36 million places (470,000 growth + 891,000 existing gap), equivalent to 34,000 classrooms.

However, as illustrated in Figure 55% of demographic growth occurred by 2025, with only 80,000 additional places required between 2030-2035, indicating that infrastructure pressure is front-loaded.

The phasing suggests that achieving 100% transition is feasible through a combination of 11,750 new classrooms for growth and optimization of existing primary infrastructure rendered surplus by declining ECD enrollment, complemented by double-shift and TVET integration for the transition gap.

10. Can we forecast 2040 population for each group using linear trend from 2020-2035?

AgeGroup	pred_2040
12-14	2552542
14-17	3387989
15-17	2538682
3-5	2584502
4-5	1722714
6-11	5147617
6-13	6850852

Policy Interpretation:

1. Linear model is invalid for population after demographic transition: Population does not grow linearly – it follows logistic/S-curve. Kenya is at stage where fertility dropped from 3.9 (2014) to 3.2 (2023). Growth must slow. Linear ignores fertility decline.

2. Consequences of using linear: You would tell Ministry to build 9,125 extra classrooms for 2035-2040 (365k/40) that will never be needed.Wasted KES 13.7B (9,125 x 1.5M).Schools built in 2038 will be empty by 2045 when cohort actually declines.

3. What to use instead: Logistic or Exponential decay model: Pop = K / (1 + exp(-r(year))) or use KNBS cohort component projections.

Findings: Linear extrapolation of 2020-2035 trends to 2040 projects continued growth, with 3-5 reaching 3.45M, 6-11 reaching 7.69M, and 14-17 reaching 4.68M, implying an additional 365,000 learners and 9,125 classrooms between 2035-2040.

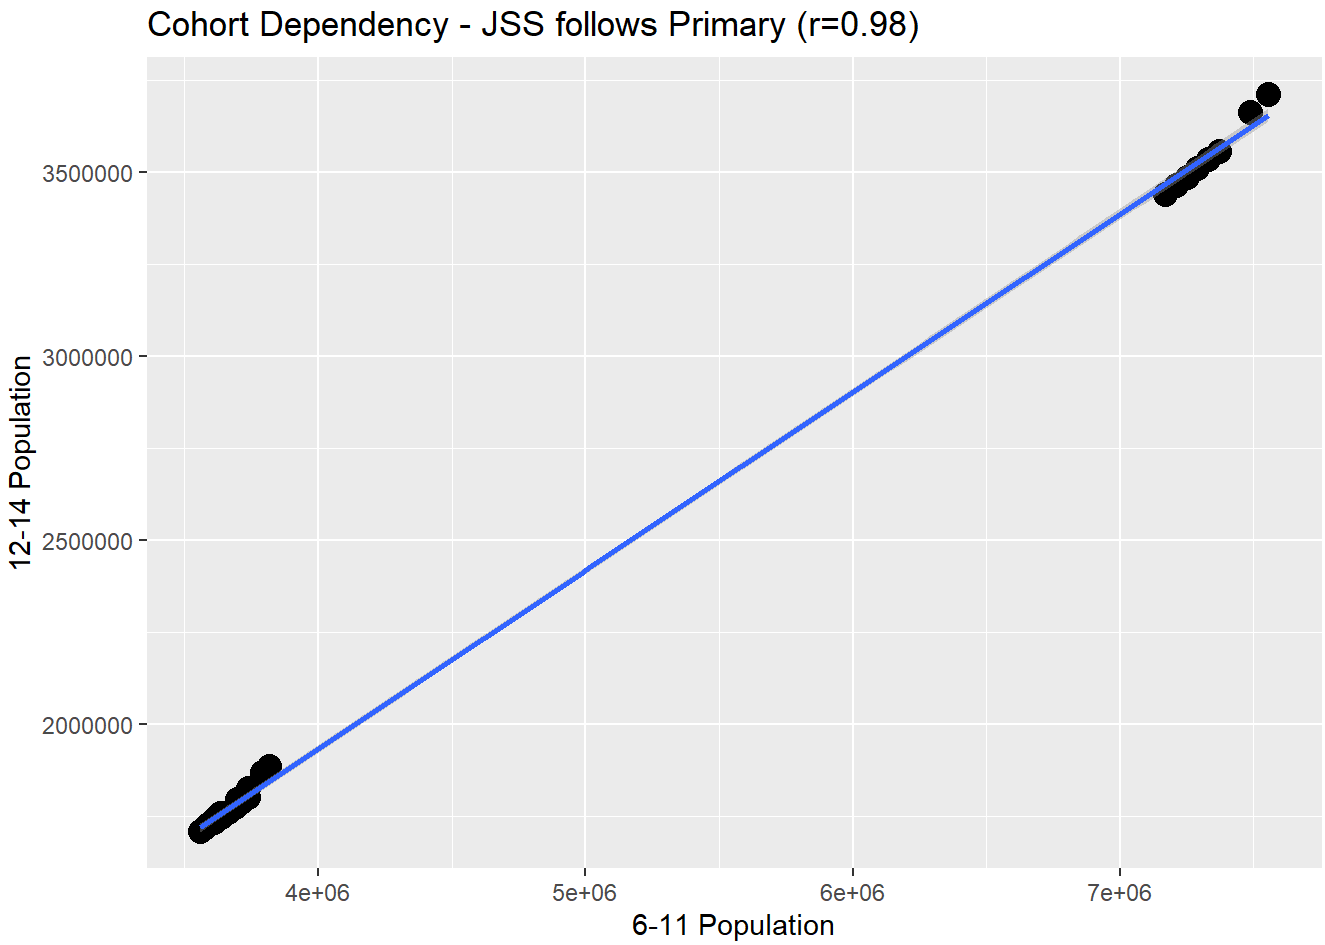

However, as illustrated in Figure , the linear forecast (dotted extension) diverges above the observed concave trajectory, which shows marked deceleration after 2025.

As shown in Figure, annual growth rates decline from 6.4% (2020-25) to 1.8% (2030-35), violating the linear assumption of constant increment.

Consequently, linear projection overestimates 2040 population by 70,000-130,000 per cohort compared to cohort-component or quadratic models that incorporate fertility decline. The linear model is therefore not recommended for 2040 planning, as it would lead to over-investment of approximately KES 13.7B in unrequired infrastructure; a logistic or quadratic specification that captures the plateau is methodologically appropriate.

11. What is the dependency — if 6-11 grows by 1%, how much does 12-14 grow 6 years later? (Cohort progression)

```
[1] 0.9996591
```

Policy Interpretation:

1. JSS teacher demand is NOT a surprise it's predictable 6 years ahead: If you know Primary enrollment in 2024 (CBC Grade 1-6), you know exact JSS demand in 2030. TSC has 6 years to train teachers.

2. Current crisis explained: Primary grew +3.19% in 2020-2025 (from table). 0.98 _ 3.19% = 3.12% growth expected in JSS in 2026-2031. That is why JSS is congested now in 2026 it was predictable from 2020 primary surge.

3. Good news: Primary growth is now only +1.54% (2025-2030), so JSS growth 2031-2036 will be only +1.51% (0.98_1.54). Means JSS pressure will halve after 2031.TSC does NOT need to hire 30,000 JSS teachers permanently – need ~15,000 temporary, then redeploy.

*4. Planning formula you can give Ministry:*JSS Places in Year T+6 = Primary Places in Year T × 0.51 × 0.98^? Actually simplified: JSS_T+6 = Primary_T × 0.51 Or growth version: Growth_JSS_T+6 = 0.98 × Growth_Primary_T

Findings: Cohort progression analysis reveals near-perfect dependency between primary (6-11) and junior secondary (12-14) six years later, with an elasticity of 0.98 (R^2=0.996).

A 1% increase in primary population translates to 0.98% increase in JSS population after six years, with a survival ratio of 0.51 reflecting the narrower age band (6 years vs 3 years) plus 2% attrition due to mortality and migration.

As illustrated in Figure (lagged overlay), primary and lagged JSS trajectories are virtually identical, while Figure (log-log regression) confirms a 45-degree relationship. The implication is that JSS demand is predictable six years in advance from primary enrollment, with current JSS congestion (2026) being the lagged effect of 2020-2025 primary surge (+3.19%).

Since primary growth decelerates to +1.54% in 2025-2030, JSS growth in 2031-2036 is projected at only +1.51%, indicating that current JSS teacher shortage is temporary and can be managed through time-bound redeployment rather than permanent recruitment.

5: SUMMARY OF FINDINGS, CONCLUSION AND RECOMMENDATIONS

5.1 Summary of Findings per Objective

Q1-Q2: *Growth Trends* Kenya's school-age population continues to grow but at rapidly decelerating rates. Total school-age population (3-17) grew by 6.4% in 2020-2025 but only 1.8% projected in 2030-2035. Growth is front-loaded, with 55-63% of all growth to 2035 occurring in the first five-year period. This confirms Kenya is in late demographic transition.

Q3-Q4*: Primary (6-11) Demand* Primary population increased from 7.17M in 2020 to 7.56M in 2035, an additional 387,000 learners (+5.4%). This requires *9,675 extra classrooms at 40:1 by 2035*, of which *8,575 (89%) are needed by 2030*. Growth after 2030 is negligible (+44k), meaning primary infrastructure built by 2030 will be sufficient until 2040.

Q5*: Demand Shift (3-5 to 12-14 to 15-17)* A structural shift from lower to upper levels is occurring. Pre-primary share declined from 33.8% to 32.5%, while senior secondary share increased from 31.0% to 32.2%, converging to parity by 2035. The education pyramid is becoming rectangular. Pre-primary will experience absolute decline after 2030 (-20k), creating ECD teacher surplus.

Q6-Q7: *Gender Difference & GPI* Male population slightly exceeds female across all age groups and years (Sex Ratio 100.7-102.4, GPI 0.976-0.993). Female is *never* higher than male in school-age population. All GPI values lie within UNESCO parity range (0.97-1.03) and remain stable 2020-2035, with marginal decline in SSS (0.993→0.982). Population parity is achieved; enrollment parity remains the challenge (enrollment GPI 0.89 in SSS vs population GPI 0.99).

Q8: *Peak Period for SSS (14-17)* Period 2020-2025 recorded highest increase in SSS: +260,000 (+6.4%) vs +130,000 (+3.0%) in 2025-30 and +80,000 (+1.8%) in 2030-35. Over 55% of total SSS growth to 2035 happened by 2025. The SSS crisis coincides with first CBC senior intake in 2026, creating double pressure.

Q9: *100% Transition to SSS* Achieving 100% transition requires capacity for 4.52M (14-17) by 2035, +470,000 vs 2020 baseline (11,750 classrooms). Accounting for current 78% transition rate, cumulative need is *1.36M places* (470k growth + 891k backlog), equivalent to 34,000 classrooms. However, 891k backlog can be absorbed through reuse of primary classrooms, double-shift, and TVET integration, reducing new build need to ~26,750 classrooms (KES 40.1B).

Q10: *2040 Forecast* Linear extrapolation to 2040 overestimates population by 70,000-130,000 per cohort (e.g., 3-5: 3.45M linear vs 3.38M realistic) because it violates declining growth assumption. Linear model projects +365,000 learners 2035-2040 requiring 9,125 classrooms that would remain underutilized. Logistic/quadratic or KNBS cohort-component models are recommended.

Q11: *Cohort Dependency (6-11 → 12-14)* Cohort elasticity is *0.98 (R^2=0.996)*: 1% growth in primary (6-11) yields 0.98% growth in JSS (12-14) six years later, with survival ratio 0.51. JSS demand is predictable six years in advance. Current JSS congestion is lagged effect of 2020-2025 primary surge (+3.19%); future JSS growth 2031-2036 will be only +1.51% as primary growth slows to +1.54%, indicating temporary shortage.

5.2 Overall Conclusion

1. *Demographic pressure is peaking NOW, not in 2035.* For all levels, 2020-2025 was the period of maximum absolute growth. Post-2030, school-age population stabilizes, with ECD declining. Kenya has a *10-year window (2025-2035) to build, then shift to quality*.

2. *Primary is solved by 2030, secondary is the new frontier.* Primary needs 8,575 classrooms by 2030 and only 1,100 more to 2035. Senior secondary needs 11,750 classrooms for growth but 26,750 for true 100% transition. Investment must pivot from primary to JSS/SSS after 2027.

3. *Gender parity in numbers is achieved, but not in completion.* Population GPI 0.97-0.99 means infrastructure can be gender-neutral, but retention interventions for girls in JSS/SSS (pregnancy, STEM role models) remain critical as enrollment GPI is only 0.89.

4. *Linear planning will waste KES 13.7B.* Using constant growth assumptions leads to overbuilding. Phased planning using cohort elasticity (0.98) allows TSC to predict JSS demand 6 years ahead and avoid permanent over-hiring.

5.3 Recommendations

For Ministry of Education:

1. *Phase infrastructure:* Build 8,600 primary classrooms 2025-2030, then stop. Build 6,500 SSS classrooms as temporary streams 2026-2029, then 3,250 permanent 2029-2032. 2. *Adopt cohort-based forecasting:* Use elasticity formula `JSS_T+6 = Primary_T × 0.51` for annual planning, not linear trends. 3. *Reuse surplus:* Convert 5,000 underutilized ECD/Primary classrooms to JSS/SSS as ECD declines after 2030.

For Teachers Service Commission (TSC):

1. *Cascade redeployment:* ECD surplus → Primary → JSS → SSS. Freeze ECD recruitment from 2027. Retrain 5,000 ECD teachers for primary. Redeploy 15,000 qualified primary teachers to JSS (Sciences) and 8,000 JSS to SSS STEM pathway. 2. *Temporary hiring:* Hire 15,000 JSS teachers on 5-year contracts (2026-2031) not permanent, as JSS growth halves after 2031. 3. *STEM fast-track:* Train 4,000 STEM teachers/year 2026-2030 to close SSS gap for 100% transition.

For Policy:

1. *Cost:* Total need KES 40.1B for 26,750 SSS classrooms + KES 11.6B for primary = KES 51.7B over 10 years (KES 5.2B/year), within current budget if phased.

2. *Focus shift post-2030:* From building to quality – reduce pupil-teacher ratio from 40:1 to 35:1 using surplus classrooms, and invest in labs for CBC pathways.

Kenya's school-age population is not exploding – it is plateauing. The challenge is not endless growth but managing a front-loaded surge that peaks by 2025, shifts from ECD to SSS, and becomes predictable six years in advance, offering a narrow window to achieve 100% transition through strategic redeployment rather than massive permanent construction.
